## Overview

---

There are three main types of concentrating solar thermal power systems: 1. Linear concentrating systems, which include parabolic troughs and linear Fresnel reflectors 2. Solar power towers 3. Solar dish/engine systems .

Linear concentrating systems collect the sun's energy using long, rectangular, curved (U-shaped) mirrors. The mirrors focus sunlight onto.

Solar dish-engine systems use a mirrored dish similar to a very large satellite dish. To reduce costs, the mirrored dish is usually made up of many smaller flat mirrors formed into a dish.

A solar power tower system uses a large field of flat, sun-tracking mirrors called heliostats to reflect and concentrate sunlight onto a receiver on.

How does a solar thermal power plant work?

The most common type of solar thermal power plants, including those plants in California's Mojave Desert, use a parabolic trough design to collect the sun's radiation. These collectors are known as linear concentrator systems, and the largest are able to generate 80 megawatts of electricity [source: U.S. Department of Energy].

How can a solar thermal power plant withstand a high temperature?

Together with industrial partners, we transfer innovations from the laboratory to large-scale applications. New heat transfer and storage media can withstand temperatures of 600 °C, higher than has previously been possible in solar thermal power plants. This increases the efficiency of converting solar radiation into heat and then into electricity.

What makes a solar thermal power plant an active system?

An active system requires some way to absorb and collect solar radiation and then store it. Solar thermal power plants are active systems, and while there are a few types, there are a few basic similarities: Mirrors reflect and concentrate sunlight, and receivers collect that solar energy and convert it into heat energy.

What are the location requirements for solar thermal power plants?

The location requirements for solar thermal power plants are comparatively low. Stony, rocky and gravel deserts with little vegetation are suitable, as are grasslands, scrublands and savannahs, for which there are practically no other economic uses, and which are available in almost unlimited quantities for this application in the Sun Belt.

How to increase water temperature in a solar thermal power plant?

To raise the water temperature to the desired high levels, maximum solar radiation must be concentrated at one point. In this way, temperatures of 300°C to 1000°C can be obtained, which will be used to generate steam. The higher the temperature, the greater the thermodynamic performance of the solar thermal power plant.

Can solar thermal power plants replace fossil fuel power plants?

Solar thermal power plants can replace fossil fuel power plants in their role as base load and peak load generators. For direct, decentralised power supply to industrial areas, smaller CSP systems are economically interesting if the industrial customers buy not only electricity but also process heat. 4. Are solar thermal power plants competitive?
