## Overview

---

Beginning in 1975, Robert E. Lucier applied for patents on a solar chimney electric power generator; between 1978 and 1981 patents (since expired) were granted in Australia, [18] Canada, [19] Israel, [20] and the US.

The solar updraft tower (SUT) is a design concept for a for generating electricity from low temperature solar heat. Sunshine heats the air beneath a very wide greenhouse-like roofed collector.

A chimney turbine was envisioned as a , and illustrated 500 years ago by . An animal spitted above a fire or in an oven could be turned by a vertical axis turbine with four angled vanes in the chimney updraft. Alfred Rosling Bennett.

Updraft• The proposal replaces the physical chimney by a controlled or 'anchored' cyclonic updraft vortex. Depending on the column gradient of temperature and pressure, or buoyancy, and stability of the.

Power output depends primarily on two factors: collector area and chimney height. A larger area collects and warms a greater volume of air to flow up the chimney; collector areas as large as 7 kilometres (4.3 mi) in diameter have been discussed. A larger chimney height.

The traditional solar updraft tower has a power conversion rate considerably lower than many other designs in the (high temperature) group of collectors. The low conversion rate is balanced to some extent by the lower cost per square metre of.

A solar updraft power station would require a large initial capital outlay, but would have relatively low operating cost. Capital outlays would be roughly the same as next-generation nuclear plants such as the AP-1000 at roughly \$5 per watt of capacity. As with other.
