Bowei distribution network assembly

Overview

What is a secondary distribution network?

Secondary distribution network includes medium voltage/low voltage (MV/LV) step-down transformers and LV lines, for example, 230 and 400 V, which deliver the power generated to LV commercial and residential consumers. The UK's power system structure is shown in Fig. 1.1.

How are distribution networks and power generation stations connected?

Distribution networks and power generation stations are connected via transmission lines. Usually, transmission lines transmit a high amount of power through high-voltage links between main load centers. A brief description of each system is given below (Mariam et al., 2013).

What is a distribution network?

Distribution networks are considered as a passive termination of the transmission network with a radial structure, unidirectional power flows, and a simple and efficient protection scheme. However, with the integration of a large number of Distributed Generators (DGs), distribution networks will change toward a new type of active network.

How can bulk load demands be connected to primary distribution networks?

From medium voltage distribution lines, e.g., 11 and 25 kV, or distribution substation, the energy will be taken one step closer to end users; thus, bulk load demands can be connected to primary distribution networks.

What is the main part of a primary distribution network?

The main part of the primary distribution network is the distribution substation that receives the energy delivered by the transmission and subtransmission networks and performs another voltage reduction.
