Commercial solar power generation in the development zone

Overview

Are solar facilities regulated by zoning?

Solar facilities generating power for on-site use are typically regulated as by-right uses depending on their size and location. Utility-scale solar facilities, however, should in most cases be conditionally permitted regardless of the zoning district and are most appropriate on brownfield sites, in remote areas, or in agriculturally zoned areas.

Why is commercial solar development increasing?

This expected increase in commercial solar development is because the typical return on investment for a solar system has been shortened to 5 to 8 years thanks to the extended federal tax credit, various state rebates, and five-year accelerated depreciation.

Will distributed solar PV capacity grow in 2024?

Globally, distributed solar PV capacity is forecast to increase by over 250% during the forecast period, reaching 530 GW by 2024 in the main case. Compared with the previous six-year period, expansion more than doubles, with the share of distributed applications in total solar PV capacity growth increasing from 36% to 45%.

How can government boost commercial solar development?

Government is providing incentives to boost commercial solar development. Decarbonizing the built environment plays an increasingly key role in climate change mitigation strategies. The process often includes solar photovoltaic (PV) systems, which are becoming more affordable than ever before.

Should utility-scale solar facilities be permitted in a zoning district?

Utility-scale solar facilities, however, should in most cases be conditionally permitted regardless of the zoning district and are most appropriate on brownfield sites, in remote areas, or in agriculturally zoned areas. This is

particularly true for more populated areas due to the more compact nature of land uses.

How has solar energy generating capacity changed since 2009?

Photovoltaic (PV) solar energy generating capacity has grown by 41 per cent per year since 2009 ¹. Energy system projections that mitigate climate change and aid universal energy access show a nearly ten-fold increase in PV solar energy generating capacity by 2040 ^{2, 3}.
