## Overview

---

Maintaining a solar energy system involves cleaning the panels, inspecting the components for damage, monitoring performance, and ensuring that all parts are functioning correctly.

Maintaining a solar energy system involves cleaning the panels, inspecting the components for damage, monitoring performance, and ensuring that all parts are functioning correctly.

Common activities include cleaning the panels with water and a soft brush, trimming nearby trees to reduce shade and minimize debris, and inspecting the panels for cracks or chips.

That includes checking for frayed wires, testing outlets, not leaving appliances plugged in and keeping an eye on your breaker for any issues.

This includes, but is not limited to, adjustments, cleaning, lubrication, repairs, replacements, and the extension of equipment life.

Some of the maintenance services involved in solar systems include: Carrying out visual inspections  
Checking on PV system operations  
Troubleshooting with corrective actions  
Monitoring and managing the system on a continuous basis  
How often should a solar panel be cleaned?

Solar panels require very little maintenance, especially if they are on a tilt, as rain can wash away any debris. It is generally recommended that you perform solar panel cleaning between two and four times per year. Take extreme care when cleaning. Clean from the ground, as climbing around on your roof can be dangerous.

What is operation & maintenance (O&M) of photovoltaic (PV) systems?

This guide considers Operation and Maintenance (O&M) of photovoltaic (PV) systems with the goal of reducing the cost of O&M and increasing its effectiveness. Reported O&M costs vary widely, and a more standardized approach to planning and delivering O&M can make costs more predictable.

What are NREL's best practices at the end of photovoltaic system performance period?

NREL's Best Practices at the End of the Photovoltaic System Performance Period report includes recommendations for system owners, asset managers, and industry service providers regarding the handling and disposal of waste, including reuse and recycling of PV modules and other components as a way to reduce environmental impact.

What types of PV systems are covered by this document?

This document is targeted at fleets of third-party-owned, grid-connected PV systems of the following size classes: residential rooftop (typically less than 10 kW); commercial and industrial rooftops and shade structures (10 kW to 1,000 kW); and ground-mounted systems (often greater than 1,000 kW).

Why does a PV plant need a monitoring system?

Advanced operation of a PV plant such as modulating output or power factor can confound the drawing of conclusions from monitored data. A monitoring system should account for clipping of output due to high DC-to-AC ratio, interconnect limits, and called-for curtailment or any other reason.

How long do PV modules last?

PV modules are unique in that they carry very long-term performance warranties of 20 or 25 years (very few types of electrical equipment have such long warranties).
