The elevated design structure, also known as a high-rise design structure, improves solar efficiency while using less amount of roof space. Solar panels are placed at a height of 6 to 8 feet above ground level.

The design and size of solar structure components have grown more important as solar panels increase. The size of different components, such as legs, rafters, purlins, and their corresponding thicknesses, must be carefully considered to ensure the strength and lifetime of solar panel arrays.

Calculate the number of solar panels needed for this system. Considering a well-designed solar system with 86% efficiency (14% loss), divide the solar system size (AC) in step 4 by 0.86. It looks like:  $7.55 \text{ kW} / 0.86 = 8.78 \text{ kW}$ . Let's say you want to use a solar module with a nominal name plate power of 220 Watt.

Ballasted, unattached PV systems on low-slope roofs have to meet seven conditions to comply with seismic load requirements in Section 13.6.12. For low-profile systems, the height of the center of mass of any panel above the roof surface must be less than half the least spacing in plan of the panel supports, but in no case greater than 3 feet.

Increased Elevation: Panels are mounted higher above the ground or roof surface, which can help reduce shading from nearby objects and improve airflow. Space Utilization: Elevated structures allow for dual use of the space beneath the panels, such as parking lots, agricultural fields (agro photovoltaics), or industrial facilities.
