If you want to connect solar panels at home by yourself, you only need a few tools and can install them in a few simple steps. It is best to prepare a toolkit containing MC4 connectors, crimping pliers, wire strippers, and a wrench for matching connectors. All of these can be easily purchased on Amazon.

Solar panel connectors safely lock PV wires in place while resisting harsh exposure to the elements and solar radiation for decades. This safety mechanism also reduces electrical arcing, making solar arrays safer.

A crucial step, if you're going for a fixed installation, includes mounting your solar panels. This DIY guide covers how to mount rigid rooftop solar panels. You'll find everything you need to know, from the components and materials required to the best location for mounting and step-by-step instructions.

Wiring solar panels together can be done with pre-installed wires at the modules, but extending the wiring to the inverter or service panel requires selecting the right wire. For rooftop PV installations, you can use the PV wire, known in Europe as TUV PV Wire or EN 50618 solar cable standard.

If you have two or more solar modules to wire in series, the MC4 connectors make it very simple. Take a look at the first module and you'll notice that it has two wires extending from the junction box. One wire is the DC positive (+) and the other is the DC negative (-).
