

## European Solar and Energy Storage Solutions

**Generator exhaust is directly discharged into the room**

## Overview

---

The generator set for test case, shown in Figure 5, is a 1250 kW with a horizontal discharge and the exhaust outlet out the top of the enclosure. The enclosure has side inlets toward the rear on each side.

The generator set for test case, shown in Figure 5, is a 1250 kW with a horizontal discharge and the exhaust outlet out the top of the enclosure. The enclosure has side inlets toward the rear on each side.

systems located outside a building are often exhausted directly out the top of the units. Units located inside a building often require the exhaust to be routed up through the roof, up the side of the building, or to a free-standing stack. Generator exhaust systems for years have been fabricated from sections of schedule 40.

The exhaust discharged upwards at about 45 degrees with a 60 degree cut-back so as to avoid rain entering the exhaust. It might also be a good idea to exhaust the the generator into a duct in the plenum which is also sucking air from the generator room so that the exhaust is diluted with plenty of cold air near the generator to prevent .

Exhaust fans must be placed at heights and vertically above the generator for heat extraction and undesirable emissions. To Conclude Understanding the generator room ventilation intricacies and requirements is a step towards harnessing the more required output and effective prevention of losses in multiple terms.

This guide addresses engine room ventilation considerations that apply to the successful installation, operation and maintenance of Cat engines, generator sets, compressor units, and other packaged units. The primary aspects of a properly designed engine room ventilation system are cooling air and combustion air. Where should exhaust air be sourced for a generator?

For generators with remote radiators, it is recommended that the exhaust air should be sourced as high as possible and directly above the generator sets. Significant bypass of ventilation airflow directly into the discharge airflow will

lead to reduction in cooling effectiveness and elevated temperatures within the room.

How do generator exhaust systems work?

Units located inside a building often require the exhaust to be routed up through the roof, up the side of the building, or to a free-standing stack. Generator exhaust systems for years have been fabricated from sections of schedule 40 carbon steel pipe that are field welded, then insulated to reduce surface temperatures.

Does a generator have a muffler?

Generator sets are almost always provided with an exhaust silencer (muffler) to limit exhaust noise. Silencers are available in several different sound attenuation grades commonly referred to as Industrial, Residential, Critical, and Hospital and can reduce exhaust noise from 12-40 dB.

Why do generator exhaust systems need to be properly designed?

Generator exhaust systems need to be properly designed to ensure correct engine performance and safe operation. System design has become more complex with the desire to keep emissions low, along with the desire to utilize the heat energy in the exhaust gas.

How does a radiator discharge affect the performance of a generator?

Radiator discharge and flue exhaust can also impact the performance of equipment outside and in the vicinity of the generator room. For example, recirculation of radiator-discharge air or flue exhaust can impact performance of heat-rejection equipment such as air-cooled chillers, condensers, cooling towers, and dry coolers.

Do generators need ventilation?

For generators located indoors, ventilation must be considered. Heat from the engine, radiator, alternator, and exhaust system could raise the operating temperature of the equipment and must be vented to obtain proper room temperature. Design of an EPS ventilation system should consider the following:

## Generator exhaust is directly discharged into the room

---

### Proper Room Ventilation for Indoor Generator Operation

The air should flow over the entire generator horizontally, thereby cooling the alternator and effectively purging internal heat. As for the exhaust fans, they should be placed high and directly above the generator to ...

### How to Install Exhaust Pipe of 400kVA Diesel Generator

7) The smoke exhaust terminal outlet of flood control generator set shall not directly face flammable substances or buildings. 8) The smoke exhaust outlet of the unit shall not bear heavy pressure, and the steel pipeline ...
