As far as renewable energy is concerned, storing surplus power allows the lights to stay on when the sun goes down or the wind stops blowing. Simply put, energy storage allows an energy reservoir to be charged when generation is high and demand is low, then released when generation diminishes and demand grows.

Supercapacitor energy storage enables wireless solar lighting. Use supercapacitor power to build an ATtiny microcontroller lighting circuit.

The use of such a reliable solar energy-driven lighting system, with maximum time when the light is “on”, will eliminate the sudden-death of light problem present in conventional photovoltaic (PV) outdoor lights and, therefore, will enhance the natural surveillance and feeling of safety in sustainable buildings and cities.

Solar lighting systems offer an energy-efficient and eco-friendly alternative for illuminating your outdoor spaces. Compared to traditional lighting solutions, solar lights rely on the sun to generate electricity to power their LED (Light Emitting Diode) bulbs, which means lower energy bills and less environmental impact.
