# How many volts does a 8kw photovoltaic inverter have

## Overview

---

I have the Deye 8kw myself. Do NOT go over 400V total STC VoC (see the back on the panels, typical just under 50V per panel). That makes each string 8 in series (400V) as the max charging on this models MPPT is 425V. The OP is talking about a 3phase inverter which can support a higher Voc.

When building a PV array, you need a few important numbers. These numbers are your inverter's maximum input voltage and your PV array voltage. Your PV array voltage is the total voltage of all of your modules when connected in a series. The more modules connected in series, the higher your array voltage.

The fixed string voltage ensures operation at the highest efficiency at all times independent of string length and temperature. The following SolarEdge solar inverter models are available: Single Phase Inverter. 2.2kW, 3kW, 3.5kW, 4kW, 5kW, 6kW; Replaced Models - refer to Discontinued section in Downloads page; Three Phase Inverter.

A PV to inverter power ratio of 1.15 to 1.25 is considered optimal, while 1.2 is taken as the industry standard. This means to calculate the perfect inverter size, it is always better to choose an inverter with input DC watts rating 1.2 times the output of the PV arrays.

Most PV systems don't regularly produce at their nameplate capacity, so choosing an inverter that's around 80 percent lower capacity than the PV system's nameplate output is ideal. Learn about how solar software can help make solar design and sales easier. What wattage should a solar inverter be?

Solar inverter sizing is rated in watts (W). As a general rule of thumb, your solar inverter wattage should be about the same as your solar array's total capacity, within the optimal ratio. For example, a 6.6kW array typically uses a 5kW inverter.

How do I choose the right solar inverter size?

When it comes to solar inverter sizing, installers will consider three primary factors: the size of your solar array, geography, and site-specific conditions. The size of your solar array is the most important factor in determining the appropriate size for your solar inverter.

What is the difference between PV array voltage and inverter voltage?

These numbers are your inverter's maximum input voltage and your PV array voltage. Your PV array voltage is the total voltage of all of your modules when connected in a series. The more modules connected in series, the higher your array voltage. This is important because the more modules you have, the more power you can generate.

How much inverter capacity does a 10 kW solar array need?

Suppose you have a 10 kW solar array installed in a location with an ambient temperature of 35°C and an altitude of 1500 meters. Assuming an inverter efficiency of 95% and a derating factor of 0.9 (based on temperature and altitude), the required inverter capacity would be - AC Inverter Capacity =  $(10 \text{ kW} / 0.9) / 0.95 = 11.76 \text{ kW}$ .

Are solar inverters the same size?

No, solar inverters are not the same size, as the size you need will depend on the generation capacity of your solar array. There is no one-size-fits-all inverter, as the size affects the unit's efficiency and larger inverters are more expensive. The easiest way to calculate the solar inverter size you need is to check the DC rating.

Is a 4000 watt inverter a good size?

One may think it makes sense going for a 4000 W inverter, but this is not the case. The string inverter size is always optimized by oversizing calculations. A PV to inverter power ratio of 1.15 to 1.25 is considered optimal, while 1.2 is taken as the industry standard.
