### DISTRIBUTED PV GENERATION + ESS

## Overview

---

Installing energy storage with a solar system can help utilize the power generated when it's needed most, regardless of whether it's sunny outside at the time. Storage allows you to save that energy and use it later in the day, like when you turn the heat on at night or run the dishwasher after dinner or even when the power goes out.

Standards and Requirements for Solar Equipment, Installation, and Licensing and Certification: A Guide for States and Municipalities is one of six program guides being produced by the Clean Energy States Alliance (CESA) as part of its Sustainable Solar Ed-.

Self-generation equipment can be located on-site where the power is consumed, or an organization may own a generation facility that is located off-site where a larger or more cost-effective installation is possible. Depending on the size of the project, installing self-generation can be a longer process than purchasing green.

Your solar energy installer and local utility company can provide more information on the exact steps you will need to take to power your home with solar energy. Investigate your home's energy efficiency. Assess your solar potential and any limitations. Assess your options for going solar.

Two ways to ensure continuous electricity regardless of the weather or an unforeseen event are by using distributed energy resources (DER) and microgrids. DER produce and supply electricity on a small scale and are spread out over a wide area. Rooftop solar panels, backup batteries, and emergency diesel generators are examples of DER. How to estimate energy production from a solar energy system?

There are many software tools that will estimate energy production from a solar energy system but two freeware tools are worthy of mention: PVWatts and System Advisor Model (SAM). PVWatts is a web-based tool that requires only a few inputs.

Should I add a solar energy system to my roof?

You may be considering the option of adding a solar energy system to your home's roof or finding another way to harness the sun's energy. While there's no one-size-fits-all solar solution, here are some resources that can help you figure out what's best for you. Consider these questions before you go solar. See the Spanish version [here](#).

Should I buy or install a solar system?

Purchasing and installing a system that you fully own and maintain is no longer the only option if you want to go solar. Even if you rent your home or don't want to purchase a rooftop system, there are many programs will enable you to still benefit from solar electricity.

Can a self-employed solar installer install a solar panel system?

When a solar panel system is purchased, manufacturers may provide the buyer with installation services or maintenance and repair work. Self-employed installers typically have training and experience with installing solar power systems and are hired directly by the property owners or by a construction firm.

How do I choose the best way to use solar electricity?

Before deciding on the best way to use solar electricity at home, assess the potential solar energy that can be produced at your address. Because PV technologies use both direct and scattered sunlight to create electricity, the solar resource across the United States is ample for home solar electric systems.

How should solar panels be installed?

Mechanical equipment associated with the photovoltaic system should be treated to be as unobtrusive as possible. Solar panels should be installed on rear slopes or other locations not easily visible from the public right-of-way. Panels should be installed flat and not alter the slope of the roof.
