How much does a microgrid controller cost?  
The analysis shows that controller cost data as a percentage of total microgrid costs are relatively similar among the projects in our database and the NY Prize data despite the wide variety of system sizes, types, and uses. Controller costs per megawatt range from \$3,500/MW to nearly \$600,000/MW, excluding outliers, with a mean of \$85,000/MW.

How much does a microgrid cost per megawatt?

The analysis of total microgrid costs per megawatt shows that the community microgrid market has the lowest mean, at \$2.1 million/MW of DERs installed; followed by the utility and campus markets, which have mean costs of \$2.6

million/MW and \$3.3 million/MW, respectively. Finally, the commercial market has the highest average cost, at \$4 million/MW.

What is a microgrid cost model?

The U.S. Department of Energy commissioned the National Renewable Energy Laboratory to complete a microgrid cost study and develop a microgrid cost model. The goal is to elucidate the variables that have the highest impact on costs as well as potential areas for cost reduction. This study consists of two phases.

Can microgrid cost information be collected?

Despite the relative novelty of the microgrid market and the challenges faced when discussing microgrid costs, it is a very useful exercise to collect cost information from the microgrid community and better understand component costs and differences from one project to another. The principal goal in Phase I of the study was to collect data.

What is a microgrid project?

A subset of microgrid projects involves upgrading a facility's backup generators with networked controls, which are considered a microgrid per the DOE definition because the network control operation to upgrade the generators enables them to operate in parallel with the grid. Microgrids have different design and control architectures.

How much new generation is needed for microgrids?

The winners of the Stage 1 competition called for an average of 64% new generation, which is slightly less than the average of 71% new generation for microgrids in the community segment in the NREL cost database.

## Microgrid Costs: What Accelerates and What Inhibits a Microgrid ...

For up to 30 elements, controllers generally cost in the range of \$50,000 to \$90,000. Costs go up from there and can reach an order of magnitude of \$500,000. For many common scenarios, it may be possible to control the microgrid with only the generator controller, so that's an important question to resolve early.

## What is the Cost of a Microgrid? Think Function

The cost of the basic elements of control -- microgrid controller, real time automation controllers, remote terminal units, utility relays, communication are, in some ways, a surprisingly smaller piece of the cost puzzle than the cost of the physical infrastructure to make the desired function operate and the engineering required to sort it
