Microgrid promotion costs

Overview

What is a microgrid cost model?

The National Renewable Energy Laboratory was commissioned by the U.S. Department of Energy to complete a microgrid cost study and develop a microgrid cost model. The goal of this study is to elucidate the variables that have the highest impact on costs as well as potential areas for cost reduction. This study consists of two phases.

How much does a microgrid cost?

Microgrids are complex systems that require specialized skills to operate and maintain. Microgrids include controls and communication systems that contain cybersecurity risks. A 2018 study conducted by the National Renewable Energy Laboratory found that microgrids in the Continental U.S. cost an average of \$2 million-\$5 million per megawatt.

Are microgrids a good investment?

Microgrids that incorporate renewable energy resources can have environmental benefits in terms of reduced greenhouse gas emissions and air pollutants. In some cases, microgrids can sell power back to the grid during normal operations. Depending on the complexity, microgrids can have high upfront capital costs.

Can time-of-day pricing improve the economics of microgrids?

It was reported that time-of-day pricing could, but not necessarily, improve the economics of microgrids, depending on whether net metering is allowed. Another previous study suggested that a high solar energy penetration (i.e., 33%) scenario does not necessarily lead to savings in electricity bills.

Does a microgrid installation benefit from economies of scale?

Economies of scale While making a commercial decision regarding renewable energy microgrid installation, the life cycle cost is not the only

concern; whether an installation can benefit from economies of scale is also critical. The effect of savings due to economies of scale is usually measured by the economies of the scale factor.

How much new generation is needed for microgrids?

On average, 64% new generation is called for in the winners of the Stage 1 competition. This is slightly less than the average of 71% new generation for microgrids in the community segment in the NREL cost database.
