With a solar plus storage system, you can use that electricity to charge your energy storage system instead of exporting excess solar production to the grid. Then, when you're using electricity after the sun's gone down, you can draw from your solar battery instead of from the electric grid.

Solar or photovoltaics (PV) provide the convenience for battery charging, owing to the high available power density of 100 mW cm^{-2} in sunlight outdoors. Sustainable, clean energy has driven the development of advanced technologies such as battery-based electric vehicles, renewables, and smart grids.

Lithium-ion batteries (Li-ion) have been deployed in a wide range of energy-storage applications, ranging from energy-type batteries of a few kilowatt-hours in residential systems with rooftop photovoltaic arrays to multi-megawatt containerized batteries for the provision of grid ancillary services.

This chapter presents the important features of solar photovoltaic (PV) generation and an overview of electrical storage technologies. The basic unit of a solar PV generation system is a solar cell, which is a P-N junction diode.
