Photovoltaic panel DCAC line

Overview

Can a DC-AC converter be used in a PV-linked grid-connected MMC?

The boost dc-dc converters have been conventionally used to step up the PV output voltage and realise the MPPT [26, 27]. However, a dc-ac converter is still required to link the PV output to the MWT. In this paper, a topology of a PV-linked grid-connected MMC is proposed as presented in Fig. 1.

What are the characteristics of a photovoltaic conversion chain?

This paper is devoted to the state of the art in photovoltaic (PV) conversion chains and their architectures. Two major characteristics are considered to classify these chains. These are the galvanic isolation and the number of stages; characteristics generally localized around the DC-AC converter (inverter) at the end of the PV conversion chain.

Which topologies are used in PV-linked DC-DC conversion cells?

The dc-dc or dc-ac conversion cells are mainly FB topologies as presented in more detail in Fig. 1b. However, in the case of PV-linked dc-ac conversion cells (cells 1, 2 and 3) there are several feasible topologies including FB, HB, CFHB and CFFB.

Is a DC to AC conversion unit a building block for grid integration?

This study provides a detailed analysis of a dc to ac conversion unit as a building block of a modular multilevel converter for grid integration of photovoltaic (PV) systems. Each conversion unit contains a PV-linked multi-active-bridge (MAB) dc-dc converter followed by a grid-connected single-phase cascaded inverter.

What is a DC/DC power stage?

The first is a DC/DC power stage that converts the variable string output to a stable high-voltage DC link suitable for DC/AC inverter stage. For a single phase power stage, it is typically 400 V and for three phase, around 800 V.

This DC/DC stage also works as a Maximum Power Point Tracking (MPPT) converter.

Does PV panel output voltage change in a wide range?

The output voltage of the PV panels does not change in a wide range due to the irradiation and temperature levels and the main effect is on the output current. Therefore, the maximum power point (MPP) is changing in the PV panel which needs to be tracked accordingly using an appropriate MPPT algorithm.
