Purlins: Secondary solar Structure Components called purlins hold the solar panels in place and connect the rafters. Sizing purlins involves figuring out their span, section characteristics, and load-carrying capability, much like rafters. Purlins support the array's structural stability by uniformly distributing the panel weight over the .

several variations in part sizes and punching locations. n Optimum versatility in custom requested punch patterns and punch placements on web and flange areas. n Large selection of standard punch shapes and sizes. n Manufactured in Fontana, CA. AEP Span is your source for steel components in the.

PV panels are mounted on U-purlins which are in turn supported on existing building roof purlins. Roof top solar panel installation adds some dead load due to weight of panels and mounting systems. Once the size of the solar panel is fixed, the existing structure must be evaluated for added solar panel loads.

The document provides design calculations for the structural components of a solar panel system, including purlins, bracing, columns, rafters, and quantities. It includes wind load calculations based on the basic wind speed and applicable codes. Purlin sizing is analyzed for combined bending stresses and deflection due to dead and wind loads.Can a purlin bolt be used on a roof?

Bolting only the web of lapped purlins does not provide full structural integrity and excessive loads can be placed on the roofing screws that penetrate both purlin thickness in the lap region. The correct size and grade of purlin bolts nominated by the design engineer should be used at all times.

When should purlin bolts be tightened?

The correct size and grade of purlin bolts nominated by the design engineer should be used at all times. Bolts should be fully tightened prior to roof installation and before any loads are applied to the purlins, girts or bridging. Bolts to be snug tightened to a nominal torque of 54Nm.

What are lateral instabilities in a purlin flange?

Purlins display two types of lateral instability; lateral deflection and twist (rotation and roll). It is necessary to control these instabilities by installing suitable bracing as close as possible to the flanges of a section.

What are the different types of PV mounting systems?

Usually made from stainless steel or aluminium, most mounting systems are designed for universal application, and can come in a variety of styles including tilt frame, flat roof-mounted or ground-mounted. They can be customised to meet the size and specifications of a PV installation, as well as the style of roof or installation.

What is a fascia purlin?

These purlins feature a fluted web which adds strength and provides a lush external face when used with flat headed fascia bolts. The added advantages of this section include a down turned lip for wall fixing and a variable upturned top flange for roof pitches from 5° to 30°. a standard C section in place of a fascia purlin in fascia applications.

What is a purlin through hole clamp?

Bottom access, Purlin Through Hole clamps are Type 304 Stainless steel for higher strength and durability. The clamp allows for direct PV module mounting to purlins and other structural members. The patented pre-assembled clamps eliminate handling small parts on the job site and provide for a faster installation.
