Why is high-frequency leakage a problem for transformerless grid-connected photovoltaic systems?

One of the recently arisen issues for transformerless grid-connected photovoltaic (PV) systems is high-frequency leakage current, which flows through the parasitic capacitance of PV system and the neutral grounding resistor (NGR) of the grid.

How to assess PV leakage current?

One of the crucial steps in analysing PV leakage current and applying a proper remedy, is PV panel/string/array's capacitance modelling which depends on the power capacity and configuration of PV systems. In some references, single or double-capacitor models have been considered to evaluate PV leakage current.

What happens if a PV system leaks?

This can flow through a human body and pose serious risks if exceeding a specific value. Also, the leakage current can cause efficiency reduction, harmonic injection, and increased total harmonic distortion (THD) in the grid current [ 8 ]. Figure 1 shows an overview of the PV system, including the inverter, output inductor and grid.

How to reduce leakage current in a grid-connected photovoltaic system?

Grid-connected photovoltaic system Many topologies have been proposed in the literature to reduce leakage current. The most prominent topologies are the full-bridge structure with bipolar switching method, H5 structure [ 9 ], H6 [ 10, 11 ], and HERIC [ 12] etc.

Can leakage currents occur at the edge of a PV module?

Therefore, the leakage currents occurring at the edge may be reduced. Fig. 3 Cross section of a thin-film PV module with a glass sheet as back cover and

modelling of the possible leakage current pathways. The solar cells are negatively biased whereas the module frame is grounded. The arrow represents the direction of leakage currents.

What is the leakage capacitance of PV panels?

As several PV panels with different power are used in the proposed topology, the value of the leakage capacitance for each cell is proportional to the cell power (according to the ratio of 100 nF/kW). The simulations are carried out at 2 kW with unit power factor and the switching frequency is 16 kHz.
