

## European Solar and Energy Storage Solutions

# Photovoltaic project inverter registration

## Overview

---

Who should register a PV system with SMA inverters?

by Annika Linke, 5. Apr. 2017, 21 Comments Everyone who operates a PV system with SMA inverters should register their system in Sunny Portal. Additionally, customers who have an inverter with the SMA Smart Connected convenience package, such as Sunny Boy 3.0 – 5.0, have to activate the SMA Smart Connected in Sunny Portal as part of the package.

How do I Register my inverter?

If you have an inverter with a serial number for the lower Communication Unit (CU) and a different number for the upper Power Unit (PU), register your product using the serial number shown on the type tag of the CU (lower enclosure). What if I don't know the commissioning date?

.

How can a PV inverter be used in a utility system?

Integrate PV inverters into utility supervisory control and data acquisition systems or AMI systems. Inverters could be tied into utility communications systems, which would issue a warning to inverters in sections of the utility isolated from the mains. Any available channel, such as BPL, DSL, or coax, could be used.

Can a PV inverter provide voltage regulation?

A PV inverter or the power conditioning systems of storage within a SEGIS could provide voltage regulation by sourcing or sinking reactive power. The literature search and utility engineer survey both indicated that this is a highly desirable feature for the SEGIS.

Can PV inverters fold back power production under high voltage?

Program PV inverters to fold back power production under high voltage. This

approach has been investigated in Japan, and though it can reduce voltage rise, it is undesirable because it requires the PV array to be operated off its MPP, thus decreasing PV system efficiency and energy production.

Can inverter-tied storage systems integrate with distributed PV generation?

Identify inverter-tied storage systems that will integrate with distributed PV generation to allow intentional islanding (microgrids) and system optimization functions (ancillary services) to increase the economic competitiveness of distributed generation. 3.
