A solar cell is a semiconductor device that can convert solar radiation into electricity. Its ability to convert sunlight into electricity without an intermediate conversion makes it unique to harness the available solar energy into useful electricity. That is why they are called Solar Photovoltaic cells. Fig. 1 shows a typical solar.

The sunlight is a group of photons having a finite amount of energy. For the generation of electricity by the cell, it must absorb the energy of the.

The conversion of sunlight into electricity is determined by various parameters of a solar cell. To understand these parameters, we need to.

A wide variety of solar cells are available in the market, the name of the solar cell technology depends on the material used in that technology. Hence different cells have different cell.

What exactly is a Solar Photovoltaic Cell?

The intensity of the light: Higher sunlight falling on the cell, more is the electricity generated by the cell. Cell Area: By increasing the area of the cell, the generated current by the cell also increases. The angle of incident: If the light falling on the cell is perpendicular to its surface, the power generated by it is optimum. .

A standard PV panel datasheet provides the following parameters: open circuit voltage,  $V_{oc}$ , short-circuit current,  $I_{sc}$ , maximum power point (MPP) voltage,  $V_m$ , MPP current,  $I_m$  and maximum power,  $P_M$ .
