We demonstrate through precise numerical simulations the possibility of flexible, thin-film solar cells, consisting of crystalline silicon, to achieve power conversion efficiency of 31%.

We demonstrate through precise numerical simulations the possibility of flexible, thin-film solar cells, consisting of crystalline silicon, to achieve power conversion efficiency of 31%.

JinkoSolar's high-efficiency n-type monocrystalline silicon solar cell sets our new record with maximum conversion efficiency of 26.1%.

The first generation concerns p-n junction-based photovoltaic cells, which are mainly represented by mono- or polycrystalline wafer-based silicon photovoltaic cells. Monocrystalline silicon solar cells involve growing Si blocks from small monocrystalline silicon seeds and then cutting them to form monocrystalline silicon wafers, which are .

Photovoltaic power generation systems consisting of solar cells are expected to serve the clean power source for a new era. Technology for improving the efficiency, stability and reliability of solar cells has been developed for more than 20 years, and photovoltaic power generation systems have new advanced.

Crystalline silicon solar cells are today's main photovoltaic technology, enabling the production of electricity with minimal carbon emissions and at an unprecedented low cost.
