At a high level, solar panels are made up of solar cells, which absorb sunlight. They use this sunlight to create direct current (DC) electricity through a process called "the photovoltaic effect."

Simply put, a solar panel works by allowing photons, or particles of light, to knock electrons free from atoms, generating a flow of electricity, according to the University of Minnesota Duluth.

Solar panels work by converting the light radiation from the sun to Direct Current (DC) electricity through a reaction inside the silicon layers of the solar panel.

Solar panels are comprised of photovoltaic cells, and through a fascinating process called the photovoltaic effects, the cells convert absorbed sunlight into usable solar energy.

Here's a step-by-step overview of how home solar power works: When sunlight hits a solar panel, an electric charge is created through the photovoltaic effect or PV effect (more on that below). The solar panel feeds this electric charge into inverters, which change it from direct current (DC) into alternate current (AC) electricity.
