

## European Solar and Energy Storage Solutions

# Shu Yinbiao talks about solar power generation

## Overview

---

How will China's Energy Future be shaped?

This mainly involves pivoting to solar and wind energy and away from coal, of which China is the biggest global consumer. Beijing plans to more than double its solar and wind power capacity to 1,200 gigawatts (GW) by 2030, from 535 GW now.

Could geopolitical tensions hinder China's Energy Cooperation?

Michal Meidan, director of the China Energy Programme at the Oxford Institute for Energy Studies, said "geopolitical tensions" and "technological rivalry" between China and Western countries could also hinder the collaboration needed to improve Beijing's storage capacity.

Is China aiming for more renewable power by 2025?

China, the world's biggest electricity generator, power consumer and carbon emitter, has said it is aiming for renewable power to account for more than 50% of its total electricity generation capacity by 2025, up from 42% now. This mainly involves pivoting to solar and wind energy and away from coal, of which China is the biggest global consumer.

Will China Force grid operators to buy energy from non-fossil fuels?

But China, which runs the world's largest power system, with a total installed capacity of 2,201GW compared with 1,107GW in the United States, is pressing on. By 2030, it has said it will force grid operators to buy at least 40 percent of their power from non-fossil fuel sources, up from around 28 percent now.

Will China's solar power increase by 2030?

Beijing plans to more than double its solar and wind power capacity to 1,200 gigawatts (GW) by 2030, from 535 GW now. Such a drastic swing from coal, which generates a stable baseload power supply, to renewables, which can fluctuate with weather conditions, could play havoc with China's electricity

network, officials say.

Why is China overhauling its electricity grid?

BEIJING/LONDON, May 19 (Reuters) - One of the most pressing challenges for China to meet its pledge to cap carbon emissions this decade and pivot toward renewables is overhauling its electricity grid, the world's largest, officials and analysts say.

## Shu Yinbiao talks about solar power generation
