## Overview

---

The key requirements for connecting solar panels to heaters are: Solar panel voltage must match the heating element voltage. Solar panel wattage should meet or exceed heater wattage. Appropriate gauge wires for high amperage flows. Regulators to prevent overheating or overloading. Manual or automated switches for control.

Solar heating systems typically consist of solar panels, also known as solar thermal collectors, which absorb the sun's energy and convert it into usable heat.

Solar panels tend to perform best in cold and sunny climates because heat interferes with the conversion of sunlight into electricity. (Keep in mind that solar panels collect light, not heat.)

Active solar heating systems use solar energy to heat a fluid -- either liquid or air -- and then transfer the solar heat directly to the interior space or to a storage system for later use.
