

## European Solar and Energy Storage Solutions

# Solar power station programming

## Overview

---

A Programmable Logic Controller (PLC) is a dedicated piece of hardware that controls devices or processes based on pre-programmed, closed-loop logic. PLC programming is the process of programming or writing the logic that the controller will follow in order to control its connected devices. The logic, or PLC program, is.

The hardware drives the price. Just as PCs with more processing power cost more, so too do PLCs. The more processing power you need, the more expensive the PLC—and the amount of processing power you.

The two main benefits of hardware-based PLCs are response time and reliability. Dedicated hardware PLCs are able to react to the external plant.

Now that you've learned the PLC basics, take the next step and discover how they do their job. Our article on [Power Plant Controllers: Typical Requirements for PV Sites](#) covers the controls used to regulate active and reactive power.

The main drawback is the initial cost, as they're very expensive. It is good to think of them as a long-term investment that will pay off over time, in terms of their reliability, performance.

What are the control requirements for a solar PV plant?

The typical control requirements are anything involving production, in terms of megawatts and mega-VARs, (active and reactive power). Optimally, a solar PV plant appears to the grid as a single, unified source of power. The goal is to maximize power output (and, therefore, revenue) while supporting a stable and reliable grid.

How does a solar PV plant work?

Optimally, a solar PV plant appears to the grid as a single, unified source of power. The goal is to maximize power output (and, therefore, revenue) while supporting a stable and reliable grid. Plants can accomplish this by regulating active and reactive power through the following controls.

What is a power plant control for a PV plant?

In , a power plant control for a PV plant is proposed to accomplish grid code requirements, comparing the operation when the PV plant includes storage support and when it does not. Focusing on the ramp rate control, a model to simulate effective dispatch of energy storage units so as to ensure this requirement is shown in .

What is a SolarEdge power plant Controller (PPC)?

ns, and causing a site outage, or possibly damaging the generator. To prevent such a scenario, while maintaining the benefits of a PV inverter installation, the SolarEdge Power Plant Controller (PPC) can be used to dynamically limit solar product.

What is the difference between PV SCADA & power plant controller?

The Smart Bridge receives data from PV SCADA and from the TSO, interacts with the PPC controller and sends the PPC orders to all inverters, capacitor banks or other elements. The Power Plant Controller receives the setpoints coming from the PV SCADA or from the TSO through the Smart Bridge.

What can I expect from a solar engineering course?

Gain knowledge and skills from engineers with real-life experience in solar energy and electrical delivery fields. You will also understand solar plant components and PV modules; DC system and AC collector design; civil and geotechnical issues; and interconnection to distribution and the bulk power grid. Who Should Attend?
