door installation. This generator will operate using either vapor withdrawn liquid propane (LP) or natural gas (NG). NOTE: This generator is suitable for supplying typical residential loads such as induction motors (sump pumps, refrigerators, air conditioners, furnaces, etc.), electronic components (computer, monitor, TV, etc.), lighting loads.

The engine has its own blower and pulls cool air from the recoil side of the generator (not to mention the carb air intake just besides it). You'd want the enclosure intake vent almost next to. The exhaust fan pulls air out and causes negative pressure in the enclosure, which then pulls fresh air to ingress the intake vent, straight to the .

Liquid-cooled power capacity starts at 15kW for Diesel and 22kW for natural gas or propane. Air-cooled generators start at 7.5kW and max out at \*20-24kW. Manufacturers may rate air-cooled generators at a lower capacity for natural gas than propane, in part due to the limitations of the smaller engines. What is a diesel generator air intake & exhaust system?

The diesel generator air intake and exhaust system (DGAIES) provides the diesel engine with combustion air from the outside. The combustion air passes through a filter and silencer before being compressed by a turbocharger and cooled by the coolant system before entering the individual cylinders for combustion.

How much power does an air cooled generator have?

Air-cooled generators start at 7.5kW and max out at \*20-24kW. Manufacturers may rate air-cooled generators at a lower capacity for natural gas than propane, in part due to the limitations of the smaller engines. The larger engines found in liquid cooled models make up the difference and provide the same performance on either natural gas or propane.

How does an air cooled generator work?

However, in hot climates, an air cooled generator enclosed in a metal cabinet cools less efficiently during hot weather. Overheating can occur during extended use under a moderate to heavy load. The generator controller senses the engine temperature and if it exceeds the safety limit, the controller shuts the engine down to prevent damage.

How does a gas generator work?

It is designed to automatically supply electrical power to operate critical loads during a utility power failure. This unit is factory installed in an all-weather, metal enclosure intended exclusively for out- door installation. This generator will operate using either vapor withdrawn liquid propane (LP) or natural gas (NG).

How do I start a 60 Hz air-cooled generator?

A Operation Owner's Manual for 60 Hz Air-Cooled Generators 20 5. Press  
MANUAL button on control panel to crank and start engine. 6. Allow engine to  
stabilize and warm up for a few minutes. 7. Set generator MLCB (generator  
discon- nect) to ON (CLOSED). Standby power source now powers loads.
